

BRIEFING NOTE

Africa development evidence at a glance

Climate risk, fiscal constraint, demographic change and food and energy volatility, connected to decisions that can be monitored.

ABSTRACT

A short orientation to the pressures the 2026 Africa Sustainable Development Report treats as linked rather than separate.

KEYWORDS sustainable development, climate, fiscal policy

Africa development evidence should connect climate risk, fiscal constraints, demographic change, food and energy volatility, and uncertainty in the global environment to decisions that can be monitored.

The framing follows the African Development Bank's 2026 Africa Sustainable Development Report, which treats these pressures as a single system rather than a list.

WHAT THIS DOES NOT ESTABLISH

A summary of one report's framing; the underlying projections are the Bank's and are not re-estimated here.
